How to Restore a Compressed or Bent Fiber Top

If the top has been compressed or bent during packing or transport, don't worry — a household steam iron can usually restore it to its full, natural shape within minutes.

BEFORE

Compressed / bent fibers

Common right after unboxing or transport

TARGET RESULT

Full, natural fluff

The look to aim for once restored

Four Easy Steps to Restore

1 Set iron to medium heat

Set your steam iron to medium heat and let it build a steady, continuous flow of steam before you begin.

2 Steam from a short distance

Hold the iron just above the bent area and apply steam. Never let the hot soleplate touch the fibers directly.

3 Reshape gently by hand

Gently lift and separate the fibers with your fingers, working gradually until the compressed area regains its natural form.

4 Stand upright to set

Leave the product standing upright to cool and air-dry naturally. The fibers will settle into a fuller, more natural shape.

Keep a short, steady distance

Use medium heat and let the steam pass evenly over the compressed section. **Never hold the iron still in one spot** — keep it moving gently over a small area for the most even, natural result.

⚠ Important

Always test on a small, inconspicuous area first. Keep the hot soleplate away from the product at all times, use steam only, and avoid excessive heat or direct contact to prevent damaging the fibers.
